

# The Remission Gap

For people with chronic inflammatory conditions, remission is usually measured in numbers.

But numbers only tell part of the story.

## WHAT THE NUMBERS MAY SHOW:

Clear blood tests

Normal scans & imaging

Low disease activity scores

“Disease signs and symptoms are gone”

## WHAT THE PATIENT MAY EXPERIENCE:

Life-altering pain & fatigue

Missed days at work or with family and friends

A loss of independence

“My numbers may be normal, but I don’t feel back to normal”

Test scores matter. But they aren’t the full picture.

Studies found that patients with inflammatory rheumatic conditions such as RA measure remission based on quality of life factors such as pain, fatigue and independence.

Talk to your care team about what remission means for you.
